Portfolio project, not a client engagement. All inquiries, names and companies are **fictional**.

Inquiry Desk: n8n + AI lead intake

Customer messages arrive in every format. This workflow turns each one into a clean lead record and a reply draft, without letting the AI invent details or send anything on its own.

The workflow (n8n)

1. Receive
A webhook receives the message from a website form.

2. Validate
Python checks the input and computes a hash, so the same message is never stored twice.

3. Extract
A local AI model (Qwen via Ollama) returns contact, company, need, budget and timeline as JSON.

4. Verify
Every extracted field must appear in the original text. Anything that can't be verified is left empty and flagged.

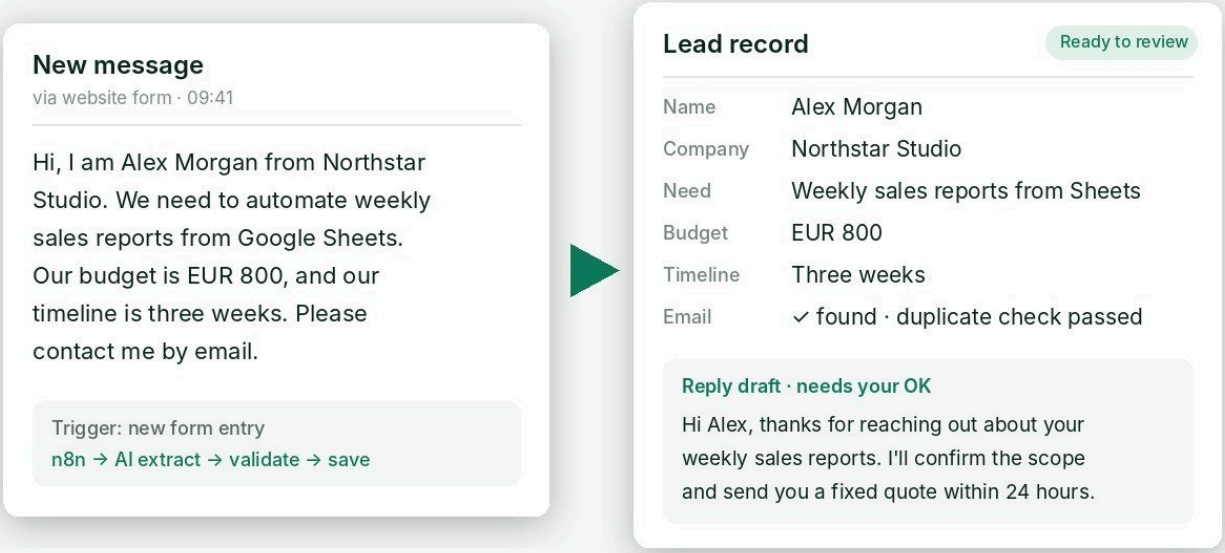

5. Draft
Missing details are listed and a reply draft is prepared from approved templates. Nothing is sent automatically.

6. Store
The lead is saved to SQLite and can be exported to CSV.

What it looks like

Any message in, a clean record out

AI extracts the details, code checks them, a reply draft waits for your OK

Example based on a recorded demo case · fictional data

Built to fail safely

When something breaks, you hear about it

Every workflow I deliver has error handling and an alert channel: which step failed, why, and whether the data was kept to re-run safely.

Illustration of the kind of alert every delivered workflow sends (fictional data).

Unit tests (9, all passing)

- Valid input and duplicate detection
- AI-invented fields are removed
- AI failure keeps the original message
- Empty, too long and wrong-type input rejected
- Failed extraction can be retried without a new record
- Structured JSON from the model is parsed safely
- Two simultaneous submissions insert only one record
- Spreadsheet formula injection escaped in CSV
- Several e-mail addresses → flagged for review

End-to-end run through n8n + AI

Complete inquiry in Chinese	**Passed**
Complete inquiry in English	**Passed**
Inquiry with missing details	**Passed**
Same message sent twice	**Passed**
Empty / invalid input	**Passed**
CSV export	**Passed**

Functional checks on a local run (2026-09-27), not an accuracy benchmark.

What a client version adds

- Real inputs: Gmail, Outlook, website forms or WhatsApp Business
- Outputs to Google Sheets, Airtable, HubSpot or your CRM
- Your choice of AI: OpenAI, Claude, or a private local model
- Error alerts to Slack, Telegram or e-mail, plus written handover notes
